Phase 1 - Brainstorming and Ideation

Project: ComicCraft - AI Comic Story Creator **Team ID / members:** Fill in your team's details **Date:** Fill in submission date

Project idea

ComicCraft is a browser-based tool that turns a short story idea into a five-panel comic. The user supplies a plot prompt, hero name, setting, tone, and art style. The application prepares a panel-by-panel story, illustration prompts, dialogue, and a downloadable PDF.

Brainstormed alternatives

Idea	User need	Feasibility	Priority
AI comic creator	Make a short illustrated story without drawing each panel	High	Selected
Story prompt helper	Help a writer expand a one-line idea	High	Supporting feature
Comic PDF exporter	Print or share a finished comic	High	Supporting feature
Character portrait generator	Create a standalone character image	Medium	Future idea
Comic sharing gallery	Save and share comics online	Medium	Future idea

Why ComicCraft was selected

The idea combines creative writing, generative AI, image generation, and a working web application. A small five-panel scope makes the result demonstrable while leaving room for later improvements. A local fallback also lets students explore the workflow without API credentials.

Problem statement

People with a comic idea may not have the drawing or writing skills, time, or software needed to create a short illustrated story. They need a simple tool that transforms a prompt into a coherent sequence of panels and a file they can share or print.

User empathy map

Persona: Student or beginner creator making a short comic for a class project or social post.

- **Says:** "I have an idea, but I cannot draw every scene." "I want the panels to follow my prompt."
- **Thinks:** "Can I make this quickly?" "Will the hero and setting stay consistent?"
- **Does:** Writes a prompt, chooses a character and visual style, previews the panels, downloads the PDF.
- **Feels:** Excited to create; frustrated by repetitive images or complicated setup; proud when the comic is ready to share.

Assumptions to validate

1. Five panels are enough for a short beginning, middle, and ending.
2. Users understand a short prompt form without training.
3. Optional cloud APIs produce more detailed images than local demo artwork.
4. Users value a printable PDF in addition to the browser preview.
