Phase 6 - Testing and Performance

Project: ComicCraft - AI Comic Story Creator **Team ID / members:** Fill in your team's details **Test date / tester / machine:** Fill in after running tests

Functional test checklist

Record actual outcomes in the Result column during your run. Do not mark a test passed before trying it.

ID	Test	Expected result	Result
T-01	Open `/`	Home page and prompt form load	Not run in this report
T-02	Submit a valid fox story prompt	Comic preview shows five story panels	Not run in this report
T-03	Submit a prompt for a different hero	Content reflects the submitted hero rather than fixed sample content	Not run in this report
T-04	Submit empty/invalid data to JSON API	Validation error is returned clearly	Not run in this report
T-05	Run without hosted API keys	Demo behavior works or explains a configuration issue	Not run in this report
T-06	Configure valid Gemini/HF keys	Hosted provider path is used where configured	Not run in this report
T-07	Download PDF	PDF opens and contains the generated panel sequence	Not run in this report
T-08	Check `/health`	JSON reports status and only boolean key status	Not run in this report
T-09	Check `/docs` and JSON endpoint	API docs load and endpoint accepts the documented request shape	Not run in this report
T-10	Inspect error path	UI gives a readable message; terminal contains diagnostic log	Not run in this report

Performance test plan

No load-test measurements are supplied with the source project. Do not report throughput, response-time percentiles, or concurrent-user capacity until they have been measured.

Field	Planned value
Tool	Locust, JMeter, or k6
Environment	Local development server first; describe hardware and network
Target	`POST /generate-comic/json`; separately measure configured AI and demo mode
Scenario A	One user, one request, record cold-start and warm response times
Scenario B	5 concurrent users for 60 seconds against demo mode
Scenario C	Increase load gradually only with provider limits and costs understood
Metrics	Success/error rate, response time, CPU/memory, provider latency
Result	Fill in after test; include date, configuration, and observed values
